INFORMATION TO USER

FCC INFORMATION

FCC Radiation Exposure Statement

This equipment complies with FCC radiation exposure limits set forth for an uncontrolled environment. This equipment should be installed and operated with minimum distance 20 centimeters between the radiator and your body.

The equipment has been tested and found to comply with the limits for a Class B Digital Device, pursuant to part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses and can radiate radio frequency energy and, if not installed and used in accordance with the instruction, may cause harmful interference to radio communication. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:

--Reorient or relocate the receiving antenna.
--Increase the separation between the equipment and receiver.
--Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
--Consult the dealer or an experienced radio/TV technician for help.

Notice: The Part 15 radio device operates on a non-interference basis with other devices operating at this frequency. Any changes or modification not expressly approved by the party responsible could void the user’s authority to operate the device.
REGULATORY INFORMATION

The Wireless LAN USB Dongle must be installed and used in strict accordance with the manufacturer's instructions. This device complies with the following radio frequency and safety standards.

USA - Federal Communications Commission (FCC)
This device complies with Part 15 of FCC Rules. Operation is subject to the following two conditions:
1. This device may not cause harmful interference, and
2. This device must accept any interference that may cause undesired operation.

Europe - R&TTE Directive
This device complies with the specifications listed below
• ETS 301 489 -1& -17 General EMC requirements for Radio equipment.
• ETS 300 328 Technical requirements for Radio equipment.
• EN 60950 Safety Requirements for Radio equipment
1. Introduction

Thank you for purchasing your Wireless Local Area Net (WLAN) USB Dongle. You are about to install a networking system that is not only fast and powerful, but also easy to set up and simple to maintain. In a short time you and those in your network will be able to share a local printer and files, access the Internet, and roam about the office wire-free.

Using radio frequency (RF) technology, WLANs transmit and receive data over the air, minimizing the need for wired connections. Thus, WLANs combine data connectivity with user mobility, and, through simplified configuration, enable movable LANs.

This wireless networking solution has been designed for both large and small businesses, and it is scalable so that you can easily add more users and new network features as your business grows.

This manual will assist you in the installing WLAN USB Dongle.
2. Wireless LAN basics

Wireless LAN network defined by IEEE 802.11b standard committee could be configured as:

- **Ad Hoc wireless LAN** or
- **Infrastructure wireless LAN**

**Ad Hoc** network is a group of notebooks with WLAN PC cards or USB dongles called a BSS (Basic Service Set). These notebooks use their WLAN PC cards or USB dongles to communicate with each other, and notebooks can not connect to the Internet.

![Figure 2-1 Ad Hoc wireless network](image)

The most obvious differentiation between **Infrastructure** wireless network and **Ad Hoc** wireless network is that the notebooks in **Infrastructure** wireless network can make use of the resource in the Internet through **Access Point**.

![Figure 2-2 Infrastructure wireless network](image)

To set up your notebook’s network as the type of “**Ad Hoc**” or “**Infrastructure**” wireless network depends completely on your requirement. Generally, if your network environment has an **Access Point**, we recommend that you set it as “**Infrastructure**” to connect to the **Internet**.
3. **Windows Installation**

The following section will assist you to install Wireless LAN USB successfully. You will first install software (driver) and then connect the Wireless LAN USB, and finally set the network properties to accommodate resource sharing and select the type of wireless network that you wish to install. The Wireless LAN can easily be installed and used, without bothering to connect cables for keeping your computer to use network resources, as in case of wired LAN.

**Before You Start**

Here are some steps you will perform in establishing your wireless network connection:

- Install the Access Point at first. AP is needed in case of infrastructure network mode.
- Install the software using the Installation CD ROM
- Install the Wireless LAN USB Dongle
- Install the network protocol(s) required to communicate on your network. Most likely you will need the TCP/IP protocol.
3.1 Installation and Configuration Utility Under Windows 98 SE

Please follow the following steps one by one in order to install the WLAN USB Dongle successfully.

Step 1. Power on your computer and allow Windows 98SE to load fully. Be sure that there is no USB dongle is connected to computer yet. Insert the given documentation CD and then double click the MY Computer icon on your desktop. In my computer window, double click the CD Drive icon. Choose Utility folder and double click Setup to execute Setup.exe. It opens the InstallShield Wizard dialog box as shown next page.
Click **Next** to continue.

Step 2. **Software License Agreement**, click **Yes** to accept.
Step 3. Select Adapter Type. Please select Application & USB Drivers then click Next.

Step 4. Click Next to search for already installed components.
Step 5. Search for already installed components

Step 6. Choose Destination Location. Click Next
Step 7. Setup will add program icons to the Program Folder listed below. You may type a new folder name, or select one from the existing folders list. Click Next to continue.

Step 8. Select operating mode. Ad hoc mode provides communication between wireless clients. Infrastructure mode provides communication between wired and wireless clients (Requires an access point). Select Infrastructure then click Next.
Step 9. ESSID is the name of a logical network group that your computer is about to join. (It can be changed again at run time by the configuration utility).

Step 10. Click **Next** to start copying files.
Step 11.  Step Status

![InstallShield Wizard](image)

WLAN USB Dongle Setup is performing the requested operations.

Installing:
C:\WLAN Utilities\WLAN USB Dongle\WlanMonitor.exe

Step 12.  Click **Finish** to exit the wizard.

![InstallShield Wizard](image)

InstallShield Wizard Complete

The InstallShield Wizard has successfully installed WLAN USB Dongle. Before you can use the program, you must restart your computer.

- Yes, I want to restart my computer now.
- No, I will restart my computer later.

Remove any disks from their drives, and then click Finish to complete setup.
Configuration Utility

WLAN USB dongle uses its own management software. All functions controlled by user are provided by this application. When you plug WLAN USB dongle into the USB port, a new icon should appear in your icon tray automatically wait a while. If the icon is in red, it means that WLAN USB Dongle configuration is invalid or incomplete.

Double click on that icon the screen is shown below.

User can navigate through “cards”, by clicking or tapping them with a stylus. In the following we explain the use and meanings of the various card.

Monitor

The field shows the association to available Access Point with Operating Mode, Channel, Tx Rate Power Management mode and MAC Address of WLAN USB Dongle. When the state is “Associated” means normal flow of operation in infrastructure mode. The PC is connected to Access Point. BSSID is chose in the form of hex digits.
“Change” / “Submit” button
This button becomes active only when one of the fields has been modified. Pressing “Change” button applies the changed values to the driver. Then pressing “Submit” button saves them to the registry.

Network Mode
This field allows you to select from a list of supported Network “Modes”. The modes displayed will have two values: “Ad Hoc” and “Infrastructure”.

Ad Hoc - This is the 802.11b peer-to-peer mode of operation. All communication is done from Client to Client without the use of an Access Point. 802.11 Ad Hoc networking uses the same SSID for establishing the wireless connection.

Infrastructure - This mode of operation requires the presence of an 802.11b Access Point. All communication is done via the Access Point, which relays packets to other wireless Clients in the BSS as well as to modes on a wired network such as Ethernet.

Channel
There are 14 channels available. The channels differ from country to country. Select the channel to be used.

SSID
SSID is the group name that will be shared by every member of your wireless network. You will be able to connect with an Access Point, which has the same SSID.

Tx Rate
The transmission rate at which the data packets are transmitted by client of AP. You can set this to 1Mbps, 2Mbps, 5.5Mbps, 11Mbps or Fully Automatic.

Signal Strength / Link Quality
The Link Quality and Signal Strength bar graph is only active when the node is in Infrastructure Mode. The bar graph displays the quality and strength of the link between the node and its Access Point. A label summarizes the quality of the Link over the bar graph.
Statistics

To check the packets status, users can press the “Statistics” tab and get related statistical figures of data and management packets.

[Image of the ATMEL Wireless LAN Monitor Utility showing the statistics tab with data and mgmt packets details.]
Site Survey

Click on the site survey tab, all access point within detectable range will be found and their related information will be displayed.
Encryption

An encryption function can avoid unintended users who are not at the same wireless LAN user group to access or get information. The “Encryption” options allow you to enable 64-bit or 128-bit WEP (wired equivalent privacy) encryption. If an encryption function is not needed, you can just simply tick on the “Disable” box to disable it. By choosing this option you must define the encryption key values of your choice. There are four 5 Hex digit encryption keys available if you select 64 bit WEP or there are four 13 Hex digit encryption keys available if you select 128 bit WEP.

WEP Key to use is a mechanism to enable the encryption function. After enabling the WEP users need to select the authentication type, open system key or shared key.

**Open System** with this setting any station in the WLAN can associate with this device to receive and transmitted data.

**Shared Key** with this setting only stations using a share key encryption identified by this device are allowed to associate with it.
In the advanced tab, you can change configuration settings such as Preamble Type, Fragmentation Threshold, and RTS/CTS Threshold. Before selecting Short Preamble, make sure that the other stations and AP’s are also supporting this feature.

Preamble Type (Short/Long)
Preamble is the first subfield of PPDU, which is the appropriate frame format for transmission to PHY (Physical layer). There are two options, Short Preamble and Long Preamble. The Short Preamble option improves throughput performance.

Fragmentation Threshold
The size at which packets will be fragmented. Choose a setting within a range of 256 to 2346 bytes.

RTS/CTS Threshold
Minimum packet size requires an RTS/CTS. For packets smaller than this threshold, and RTS/CTS is not sent and the packet is transmitted directly to the WLAN. This is the option for the RTS/CTS Threshold activation.
Version

Version tab shows the product version including the detail of driver, firmware and application version. Users must use this version number when reporting their problems for technical support.
3.2 Installation and Configuration WLAN USB Dongle Under Windows XP

Step 1. Power on your computer and allow Windows XP to load fully. Be sure that the WLAN USB dongle is not connected to computer yet. Insert the given Documentation CD and then click “start” menu select MY Computer then click. In my computer window, double click the CD Drive icon. Choose Utility folder and double click setup to execute Setup.exe. It opens the InstallShield Wizard dialog box as shown next page.

Click Next to continue.
Step 2. Software License Agreement, click **Yes** to accept.

Step 3. Select Adapter Type. Please select **Application & USB Drivers** then click **Next**.
Step 4. Click **Next** to search for already installed components.

Step 5. Search for already installed components
Step 6. Choose Destination Location. Click **Next**

Step 7. Setup will add program icons to the Program Folder listed below. You may type a new folder name, or select one from the existing folders list. Click **Next** to continue.
Step 8. Select operating mode. Ad hoc mode provides communication between wireless clients. Infrastructure mode provides communication between wired and wireless clients (Requires an access point). Select **Infrastructure** then click **Next**.

Step 9. **ESSID** is the name of a logical network group that your computer is about to join. (It can be changed again at run time by the configuration utility).
Step 10. Click **Next** to start copying files.

![InstallShield Wizard](image1)

Step 11. **Step Status**

![InstallShield Wizard](image2)
Step 12. Click **Finish** to exit the wizard.

After finish the installation please remove the CD from CD-ROM

Step 13. After the computer restarts, plug **WLAN USB Dongle** connector into USB port on computer then **Windows XP** detects the device automatically, briefly showing a Found New Hardware message and starts collecting information for a device information database.
Step 14. When Windows XP is ready to configure the new hardware, it opens the Found New Hardware Wizard dialog box as shown. A dialog box appears asking what do you want Windows to do. Select Install the software automatically (Recommended) and, Click Next.

Starting search the driver automatically.
Starting install driver automatically

Found New Hardware Wizard

Please wait while the wizard installs the software...

ATMEL USB FastVNET (A)

Hardware Installation

The software you are installing for this hardware:
ATMEL USB FastVNET (A)

has not passed Windows Logo testing to verify its compatibility with Windows XP. (Tell me why this testing is important.)

Continuing your installation of this software may impair or destabilize the correct operation of your system either immediately or in the future. Microsoft strongly recommends that you stop this installation now and contact the hardware vendor for software that has passed Windows Logo testing.

Click Continue Anyway

Hardware install finish
Click Finish

Found New Hardware Wizard

Completing the Found New Hardware Wizard

The wizard has finished installing the software for:
ATMEL USB FastVNET (A)

Click Finish to close the wizard.
Configuration WLAN USB Dongle under Windows XP

Step 1. Click **Start** menu and select **Control Panel**.

Click the **Network and Internet Connections** icon in the **Control Panel**.

![Control Panel Network Connections](image)

Right click the **ATMEL USB FastVNET (A) Wireless Network Connection** icon and select **Properties**.

![Network Connections](image)
Step 2. Select **Internet Protocol (TCP/IP)** and click **Properties**
Step 3. Set IP address and Subnet Mask. You can select either Static or DHCP setting. If you use the static IP setup then please enter the IP address and Subnet masking. You should ask your network administrator for an address, and then type it into the blanket boxes as below. Then click OK to return to Step 2. Wireless Network Connection Properties dialog box.

Static setting

DHCP setting
Step 4. Click **Install** to add Network Protocol.

![Wireless Network Connection Properties dialog box](image1)

Step 5. Select **Protocol** and click **Add**.

![Select Network Component Type dialog box](image2)
Step 6. Select protocol as the figure showing and click **OK**.

![Select Network Protocol](image1)

Step 7. The **IPX/SPX/NetBEUI** protocol is now installed. After clicking on **Close** return back to **Network Connections** window, then close the windows.

![Wireless Network Connection Properties](image2)
Step 8. Right click the Wireless Network Connection icon in notification area and select View Available Wireless Network.

Select the available networks that you want connect and then click Connect

When connection established the message box as the figure showing
Step 8. After connection established, click the Wireless Network Connection icon in notification area and then the **Wireless Network Connection Status** window as the figure showing:

Click **Properties** to configure the wireless network settings.

Click **Repair** to renew the TCP/IP.
Step 9 Configure the wireless network settings. Select an available network and then click **Configure** or **Properties**.
Network name (SSID):

SSID is the group name that will be shared by every member of your wireless network. You will only be able to connect with an Access Point, which has the same SSID.

Data encryption (WEP Enabled):

An encryption function can avoid unintended users who are not at the same wireless LAN user group to access or get information. The “Data encryption” options allow you to enable 40 bits (5 characters) or 104 bits (13 characters) WEP (Wired Equivalent Privacy) encryption. If an encryption function is needed, you can just simply tick on the “Enable” box to enable it. By choosing this option you must define the encryption key values of your choice. There are 5 Hex digits or chars encryption keys available if you select 40 bits WEP or there are 13 Hex digits or chars encryption keys available if you select 104 bits WEP.

WEP Key to use is a mechanism to enable the encryption function. After enabling the WEP, users need to select the authentication type, Shared Mode or Open system.

Network Authentication (Shared Mode):

When enable the Shared Mode, you must have a network key and each wireless station is assumed to have received a secret shared key over a secure channel, with this setting only stations using a share key encryption identified by this device are allowed to associate with it.

Network Key:

The Network Key has two formats Hexadecimal digits and ASCII characters; two key lengths 40 bits (5 characters) and 104 bits (13 characters).

Key Index (advanced):

This function provided 4 keys for selection.
**Advanced:**
This field allows you to select from a list of supported Network “Modes” to access:

“Any available network”, “Infrastructure” and “Ad Hoc”.

**Infrastructure** – This mode of operation requires the presence of an 802.11b Access Point. All communication is done via the Access Point, which relays packets to other wireless Clients in the BSS as well as to modes on a wired network such as Ethernet.

**Ad Hoc** – This is the 802.11b peer-to-peer mode of operation. All communication is done from Client to Client without the use of an Access Point. 802.11 Ad Hoc networking uses the same SSID for establishing the wireless connection.

**Any available network** – This mode can connect any available network “Infrastructure” or “Ad Hoc” but if there is any access point network available, the Infrastructure mode preferred active.

See more information or configuration about wireless network,
Click “setting up wireless network configuration”.
4. Technical Specifications of WLAN USB Dongle

Driver Supported
Microsoft Windows 98 / 98 SE / ME / 2000 / XP

Standards Supported
IEEE 802.11b standard for Wireless LAN

Radio Specifications
- Frequency Range: 2.4-2.4835 GHz, Direct Sequence Spread Spectrum
- Antenna system: External patch antenna
- Mobility: Seamless roaming across cell boundaries with handover

Power Specifications
- Operating Voltage: 5VDC
- Continuous Transmitting: 380 mA (max.)
- Continuous Receiving: 320 mA (max.)

Specific Features
- Supported bit rates: 1, 2, 5.5, 11Mbps

Number of Channels
- North America: CH1-CH11
- ETSI: CH1-CH13
- Spain: CH10-CH11
- France: CH10-CH13
- Japan: CH1-CH14
Troubleshooting

Symptom:
The power and Act LEDs are off.
Possible Remedy:
Make sure the USB hub is properly operating and connecting to the Dongle securely.

Symptom:
The USB Dongle icon does not show up in your icon tray after you plug in the USB port.
Possible Remedy:
Be sure that you should not connect any USB Dongle to your computer before you execute the Setup.exe from the attached CD. Otherwise, please check the USB connection of Dongle with Hub.
Reboot your computer, if the Setup.exe is executed in first time.

Symptom:
The USB Dongle icon is red.
Possible Remedy:
It means there is no wireless link.
1. Make sure there is any 802.11b device in the servic ing area.
2. Double click the icon to pop up the configuration window.
   a. Make sure they are sharing the same SSID and channel. If not, you could press the Site Survey → Re-Scan to search another nodes in the vicinity.
      Then you can select one of them to join.
   b. Make sure they are operating under same authentication type. WEP function has to be enabled, if Shared Key Authentication is the selection, and the secret Keys have to be same in the communicating group.
3. Position the antenna to gain the maximum RF power and make sure there is no metal objects, electron devices or cordless phone in the vicinity.

Symptom:
The USB Dongle icon is blue, but can’t access wired-LAN.
Possible Remedy:
1. Make sure there is any 802.11b AP in your LAN.
2. Make sure the Dongle is configured as infrastructure mode.
Symptom:
The USB Dongle icon is blue, but can’t share files with others.

Possible Remedy:
Make sure the file and printer sharing function is enabled. You could enable the function by checking the icon of My Computer → Control Panel → Network → file and printer sharing → I want to be able to give others to access to my files.

Symptom:
The computer will be down as the USB Dongle is live pulled-out and plugged-in under Win98 environment.

Possible Remedy:
Before you live plug in the USB Dongle, be sure the USB Dongle icon disappears after you pull out it.

Symptom:
The computer seems be halt when the USB Dongle is live pulled-out and plugged-in more than once under Win98 environment.

Possible Remedy:
Please wait for more than one minute after USB Dongle is re-plugged in.

Symptom:
It will come up some problems when you re-execute the Setup.exe after you remove USB Utility.

Possible Remedy:
You have to delete some files manually after you remove the USB Utility. Those are TCP/IP / NetBEUI / IPX/SPX→ATMEL USB FastVNET(A) from Control Panel → Network and external.rom, internal.rom from WINDOWS\SYSTEMS

Symptom:
Slow or erratic performance

Possible Remedy:
Try change the channel of the communicating group or move your device closer to the communicating device.
Glossary

IEEE 802.11 Standard
The IEEE 802.11 Wireless LAN standards subcommittee, which is formulating a standard for the industry. The objective is to enable wireless LAN hardware from different manufacturers to enteropera.

Access Point
An internetworking device that seamlessly connects wired and wireless networks together.

Ad Hoc
An Ad Hoc wireless LAN is a group of computers, each with a WLAN adapter, connected as an independent wireless LAN. Ad Hoc wireless LAN is applicable at a departmental scale for a branch or SOHO operation.

BSSID
A specific Ad Hoc LAN is called a Basic Service Set (BSS). Computers in a BSS must be configured with the same BSSID.

DHCP
Dynamic Host Configuration Protocol - a method in which IP addresses are assigned by server dynamically to clients on the network. DHCP is used for Dynamic IP Addressing and requires a dedicated DHCP server on the network.

Direct Sequence Spread Spectrum
This is the method the wireless cards use to transmit data over the frequency spectrum. The other method is frequency hopping. Direct sequence spreads the data over one frequency range (channel) while frequency hopping jumps from one narrow frequency band to another many times per second.

ESSID
An Infrastructure configuration could also support roaming capability for mobile workers. More than one BSS can be configured as an Extended Service Set (ESS). Users within an ESS could roam freely between BSSs while served as a continuous connection to the network wireless stations and Access Points within an ESS must be configured with the same ESSID and the same radio channel.

Ethernet
Ethernet is a 10/100Mbps network that runs over dedicated home/office wiring. Users must be wired to the network at all times to gain access.
Gateway
A gateway is a hardware and software device that connects two dissimilar systems, such as a LAN and a mainframe. In Internet terminology, a gateway is another name for a router. Generally a gateway is used as a funnel for all traffic to the Internet.

IEEE
Institute of Electrical and Electronics Engineers

Infrastructure
An integrated wireless and wired LAN is called an Infrastructure configuration. Infrastructure is applicable to enterprise scale for wireless access to central database, or wireless application for mobile workers.

ISM Band
The FCC and their counterparts outside of the U.S. have set aside bandwidth for unlicensed use in the so-called ISM (Industrial, Scientific and Medical) band. Spectrum in the vicinity of 2.4 GHz, in particular, is being made available worldwide. This presents a truly revolutionary opportunity to place convenient high-speed wireless capabilities in the hands of users around the globe.

Local Area Network (LAN)
A LAN is a group of computers, each equipped with the appropriate network adapter card connected by cable/air, that share applications, data, and peripherals. All connections are made via cable or wireless media, but a LAN does not use telephone services. It typically spans a single building or campus.

Network
A network is a system of computers that is connected. Data, files, and messages can be transmitted over this network. Networks may be local or wide area networks.

PCMCIA
Personal Computer Memory Card International Association. Also a PCMCIA card is also referred to PC Card.

Protocol
A protocol is a standardized set of rules that specify how a conversation is to take place, including the format, timing, sequencing and/ or error checking.
Roaming
In an infrastructure network, this is when a wireless PC moves out of range of the previously connected access point and connects to a newly connected access point. Throughout the network environment where access point are deployed, PCs can always be connected regardless of where they are located or roam.

SSID
A Network ID unique to a network. Only clients and Access Points that share the same SSID are able to communicate with each other. This string is case-sensitive.

Simple Network Management Protocol (SNMP)
Simple Network Management Protocol is the network management protocol of TCP/IP. In SNMP, agents—which can be hardware as well as software—monitor the activity in the various devices on the network and report to the network console workstation. Control information about each device is maintained in a structure known as a management information block.

Static IP Addressing
A method of assigning IP addresses to clients on the network. In networks with Static IP address, the network administrator manually assigns an IP address to each computer. Once a Static IP address is assigned, a computer uses the same IP address every time it reboots and logs on to the network, unless it is manually changed.

Transmission Control Protocol / Internet Protocol (TCP/IP)
TCP/IP is the protocol suite developed by the Advanced Research Projects Agency (ARPA). It is widely used in corporate Internet works, because of its superior design for WANs. TCP governs how packet is sequenced for transmission the network. The term “TCP/IP” is often used generically to refer to the entire suite of related protocols.

Transmit / Receive
The wireless throughput in Bytes per second averaged over two seconds.

Wide Area Network (WAN)
A WAN consists of multiple LANs that are tied together via telephone services and / or fiber optic cabling. WANs may span a city, a state, a country, or even the world.
Wireless LAN (WLAN)
A wireless LAN does not use cable to transmit signals, but rather uses radio or infrared to transmit packets through the air. Radio Frequency (RF) and infrared are the commonly used types of wireless transmission. Most wireless LANs use spread spectrum technology. It offers limited bandwidth, usually under 11Mbps, and users share the bandwidth with other devices in the spectrum; however, users can operate a spread spectrum device without licensing from the Federal Communications Commission (FCC)
